PROFESSIONAL SUMMARY

Backend software engineer specialized in payments infrastructure — ~3 years of production Ruby on Rails on a B2B payments platform moving millions of dollars daily at Corpay (NYSE: CPAY), where I owned the file-ingestion and payment-processor integration systems end to end: settlement, reconciliation, and virtual-card issuance. Now building a multi-tenant procure-to-pay platform from an empty repository through a self-designed multi-agent AI workflow with adversarial code review. U.S. Marine Corps veteran.

TECHNICAL SKILLS

Backend & Languages: Ruby on Rails, Ruby, SQL, Node.js, Express.js, JavaScript, TypeScript, React, AngularJS

Payments & Integrations: Payment-processor integration, multi-rail payments (ACH, wire, check, virtual cards via Comdata), settlement & reconciliation, webhooks & event polling, RESTful API design, SOAP, SAML SSO

Data & Infrastructure: PostgreSQL, MySQL, Elasticsearch, Redis, Sidekiq, AWS (S3, EC2, RDS, CloudWatch), Docker, SFTP

Testing & Observability: RSpec, Cypress, TDD, Postman, Runscope, Honeybadger, Datadog, CloudWatch

AI Engineering: Multi-agent orchestration, Claude Code (subagents, skills, pipelines), MCP (Model Context Protocol), adversarial code review, eval gates for AI-generated code, human-in-the-loop gating

EXPERIENCE

Senior Software Engineer / Architect / Founding Engineer — Stealth Startup, Remote | May 2026 – Present

Rehired by a former VP of Engineering as primary engineer to build a multi-tenant procure-to-pay platform from an empty repository — delivered end-to-end through a self-designed multi-agent AI workflow.

- Built a multi-tenant procure-to-pay platform from an empty repo to production on Heroku — 25+ Rails 8 models (multi-tenancy, role-based access control, vendors, purchase orders, invoicing, and chart of accounts) across 20 reviewed, CI-gated pull requests.
- Designed and ran a multi-agent AI delivery system on Claude Code (13 specialized agents) in which fresh-context reviewer agents adversarially grade every plan and pull request against a fixed rubric before merge — catching SEV-1 issues like cross-tenant data leaks early, with human approval gates on plans, commits, and risky database migrations.
- Held all AI-written code to a zero-regression bar: a ~950-example RSpec suite at a 2:1 test-to-code ratio with linting on every commit and in GitHub Actions CI, backed by 10 browser-automation playbooks agents must pass before shipping.

Software Engineer — Corpay (NYSE: CPAY), San Mateo, CA | Apr 2023 – Feb 2026 | Promoted from QA Analyst

- Joined as the company's first US-based QA hire and grew into a core Payments engineer, taking full ownership of the file-integration system — the platform's most critical pipeline — on a SaaS product processing millions of dollars in payments daily for clients up to enterprise scale (UPS); 1,670+ commits, 27,000+ lines shipped.
- Owned the bulk file-ingestion pipeline that turns one uploaded payment file (e.g., 1,500 invoices across 200 vendors) into every downstream record: parallel Sidekiq workers parse row batches concurrently, build invoices and dependencies, de-duplicate, then generate a single payment linking all records to the source document — scaled to 300,000 records per batch, with client-defined custom inbound and outbound file templates.
- Built and owned the payment-processor integration (125+ shipped changes via REST and SOAP): posts approved payments, reconciles both systems through webhook-driven polling on each payment GUID, and issues vendor virtual cards by pulling card data from Comdata — every request logged for CloudWatch audit and debugging.
- Resolved a SEV-1 payment-routing incident in an all-hands response — a batch had routed a customer's full ~\$500K to a single vendor instead of many; traced it through CloudWatch and voided every transaction before funds left the originating account, then hardened multi-vendor chunking with pre-production payment verification.

Full-Stack Developer (Intern) — HCDL, San Francisco, CA (Remote) | Oct 2022 – Jan 2023

- Built a full-stack web app with React, Node.js/Express, and MySQL: Bcrypt/JWT authentication, AWS RDS persistence, and RESTful API integrations including the Geisinger API.

Electro-Optical Ordnance Repairer — United States Marine Corps | Jun 2018 – Jun 2023

- Held U.S. Government Secret security clearance; trained personnel on confidential electro-optical systems.

EDUCATION & CERTIFICATIONS

Full Stack Development Bootcamp — UC Berkeley Extension, 2022

A.S.-T., Business Administration — Skyline College, 2022

Electro-Optics Ordnance Repairer (MOS 2171) — USMC Ordnance School, 2019

Software Developer to Architect; Workflow Automation & Scaling with Generative AI — LinkedIn Learning, 2025
